Education

University of California, Berkeley – Haas School of Business **Expected March 2027**
Master of Financial Engineering *Berkeley, CA*
Activities : Berkeley MFE Investment Fund [1 of 3 managers]
Rutgers, The State University of New Jersey **May 2023**
Bachelor of Science in Finance, Mathematics [GPA: 3.7/4.0] *Newark, NJ*

Experience

Citi Bank Oct 2026 - Dec 2026
Quantitative Researcher | UCB Industry Project| Supervisor : Peter Decrem *Berkeley, CA*

- Formulated the hedge of Italian government bonds (BTPs) with German Bund futures as a minimum-variance problem; tested where the static covariance ratio fails when Italy–Germany spreads jump in crises
- Modeled regime-specific volatility, correlation, holding times, and transition jumps to update the hedge ratio; in team out-of-sample tests, static and regime-aware futures reduced variance only 7% and 9% on the largest 5% of spread-move days.
- Proved minimum-variance optimality and jump-adjusted no-arbitrage drift; a spanning argument showed seven futures cannot cover all 20 transition shocks in a five-regime model, which requires at least 19 instruments for arbitrary jumps.
- Optimized three Bund options to hedge nonlinear jump exposure; residual jump variance fell 13.6% versus the Bund future alone in 2018/2020/2022 crises, but 19% of initial risk remained BTP-specific.

Graph Neural Networks for Equity Return Prediction *| Python, Pandas, NumPy , PyTorch* Aug 2026 - Sept 2026

- Tested whether customer–supplier links transmit return information beyond 64 firm characteristics by training TransformerConv models across six message-passing depths on approximately 150,000 out-of-sample firm-months.
- Fixed excess-return targeting and Ridge/LASSO look-ahead bias; expanded the point-in-time graph from 940 to 3,138 counterparties and built an SEC pipeline adding 14,339 edge rows.
- Monthly long–short decile portfolios earned nonannualized Sharpe ratios of 1.03/1.11 at depths 1–2, net of 5–7 bps per trade; six-benchmark spanning tests found incremental signal at four depths
- Diagnosed deeper-model failure as oversmoothing rather than overfitting: prediction dispersion collapsed from 0.035 at depth one to 0.0017 at depth ten, while train and test return correlations remained equal at 0.081.

PrismaAI: Corsair Capital *[P/E Firms]* Mar 2026 - Sept 2026
Quantitative Researcher |UC Berkeley MFE Industry Project *Berkeley, CA*

- Built a PostgreSQL panel of 1,493 PE/VC funds from 462 pension filings to study software-market conditions at investment and later fund TVPI.
- Used PCA to reduce 10 correlated market indicators to five components explaining 92.1% of variance; selected a three-state Gaussian HMM by BIC to classify market regimes.
- Found that assigning each fund its vintage-year regime masked when it actually invested. The apparent regime effect did not survive a permutation test that preserved the five market episodes.
- Contraction exposure was associated with lower TVPI; incremental explanatory power remained suggestive (within-vintage permutation (p=0.068)).

AllShifts Oct 2023 - Feb 2026
Data Engineering and Revenue Analyst *Newark, NJ*

- Built a stochastic pricing optimizer using facility-by-nurse-type ARIMA demand scenarios and seasonal rate fill curves; validated forecasts on 2024-2025 actuals and maximized expected fills within contract and margin limits.
- Fit logistic regression on 6 or 12 month delinquency and billing-to-payment histories; validated on 400 clients and deployed to 1,700+. After rollout, defaults fell 17% and payments arrived 2 weeks sooner.
- Forecast daily cash collections 1-3 weeks ahead with LightGBM using billing lags, accounting aging cohorts, and calendar effects (4.8% out-of-sample MAPE); used STL alerts to flag client deterioration.
- Built a four-week revenue-risk monitor using STL to remove seasonality and LightGBM to flag client-level declines in orders, billings, and payments.

Skills & Certifications

Programming: Python (Pandas, NumPy, Scikit-learn, PyTorch, LightGBM, statsmodels, jax), C++, SQL, R, Git, Lean
Quantitative Methods: Time-Series Forecasting, Cross-Sectional Return Modeling, Stochastic Optimization, Point-in-Time Backtesting
Work Authorization: USA F-1 OPT / STEM OPT Eligible | Cap-Exempt H-1B
Interests: Horology, Poker (SIG Qualifier, Top 25%, Berkeley Poker Club Member), Karting, Weightlifting, Cricket (State U-16)
